 $\mathcal{L}_t(v)(x) := \sigma\Big(W_tv(x) + b_t + (\mathcal{K}_t(a,\theta)v)(x)\Big)$

with
$$\mathcal{K}_t(a,\theta)$$
 linear and non-local operator.

3. **Projection:** linear and local operator $\mathcal{Q}: \mathcal{U}(D, \mathbb{R}^{d_v}) \to \mathcal{U}(D, \mathbb{R}^{d_u}), \quad \mathcal{Q}(v)(x) = W_{\mathcal{O}} \ v(x) + b_{\mathcal{O}}, \ W_{\mathcal{O}} \in \mathbb{R}^{d_u \times d_v}, \ b_{\mathcal{O}} \in \mathbb{R}^{d_u}.$

Definition of Fourier Neural Operator

Massimiliano Ghiotto UNIVERSITÀ DI PAVIA

1 Fourier Neural Operator

For defining the Fourier Neural Operator (FNO) we make the following assumptions

$$(\mathcal{K}_t(\theta_t, a)v)(x) = (\mathcal{K}_t(\theta_t)v)(x) = \int_{\mathbb{T}^d} \kappa_{t,\theta_t}(x, y)v(y) \ dy = \int_{\mathbb{T}^d} \kappa_{t,\theta_t}(x-y)v(y) \ dy = (\kappa_{t,\theta_t}*v)(x).$$

Definition of Fourier Neural Operator

1 Fourier Neural Operator

For defining the Fourier Neural Operator (FNO) we make the following assumptions

$$(\mathcal{K}_t(\theta_t,a)v)(x) = (\mathcal{K}_t(\theta_t)v)(x) = \int_{\mathbb{T}^d} \kappa_{t,\theta_t}(x,y)v(y) \ dy = \int_{\mathbb{T}^d} \kappa_{t,\theta_t}(x-y)v(y) \ dy = (\kappa_{t,\theta_t}*v)(x).$$

Using the convolution theorem we have

$$(\kappa_{t,\theta_t} * v)(x) = \mathcal{F}^{-1}(\mathcal{F}(\kappa_{t,\theta_t})(k) \cdot \mathcal{F}(v)(k))(x),$$

and parameterizing $\mathcal{F}(\kappa_{t,\theta_t})$ with the parameters $R_{\theta_t}(k) \in \mathbb{C}^{d_v \times d_v} \ \forall k \in \mathbb{Z}^d$, we have

$$(\mathcal{K}_t(\theta_t)v)(x) = \mathcal{F}^{-1}(R_{\theta_t}(k)\cdot\mathcal{F}(v)(k))(x).$$

Universal approximation for FNOs ¹

1 Fourier Neural Operator

Universal approximation theorem

Given s, s' > 0 and

$$\mathcal{G}: H^{s}(\mathbb{T}^d,\mathbb{R}^{d_s})
ightarrow H^{s'}(\mathbb{T}^d,\mathbb{R}^{d_u})$$

continuous operator. Given $K \subset H^s(\mathbb{T}^d, \mathbb{R}^{d_a})$ a compact subset and $\sigma \in \mathbb{C}^{\infty}(\mathbb{R})$ nonlinear and globally Lipschitz activation function. Then, for all $\varepsilon > 0$, exists a Fourier Neural Operator

$$\mathcal{N}: H^s(\mathbb{T}^d,\mathbb{R}^{d_a})
ightarrow H^{s'}(\mathbb{T}^d,\mathbb{R}^{d_u})$$

such that:

$$\sup_{a\in\mathcal{N}}\|\mathcal{G}(a)-\mathcal{N}(a)\|_{H^{s'}}\leq\varepsilon.$$

Pseudo Spectral Fourier Neural Operator

1 Fourier Neural Operator

Pseudo Spectral Fourier Neural Operator (ψ -FNO) is a map

$$\mathcal{N}^*: \mathcal{A}(\mathbb{T}^d, \mathbb{R}^{d_a}) o \mathcal{U}(\mathbb{T}^d, \mathbb{R}^{d_u}), \qquad a \mapsto \mathcal{N}^*(a),$$

defined by

$$\mathcal{N}^*(a) = \mathcal{Q} \circ I_N \circ \mathcal{L}_L \circ I_N \circ \cdots \circ \mathcal{L}_1 \circ I_N \circ \mathcal{R}(a),$$

where I_N denotes the pseudo-spectral projection on the Fourier polynomials of degree N

$$I_N: C(\mathbb{T}^d) \to L^2_N(\mathbb{T}^d), \quad u \mapsto I_N u.$$

Pseudo Spectral Fourier Neural Operator

1 Fourier Neural Operator

Pseudo Spectral Fourier Neural Operator (ψ -FNO) is a map

$$\mathcal{N}^*: \mathcal{A}(\mathbb{T}^d, \mathbb{R}^{d_{oldsymbol{s}}})
ightarrow \mathcal{U}(\mathbb{T}^d, \mathbb{R}^{d_{oldsymbol{u}}}), \qquad oldsymbol{a} \mapsto \mathcal{N}^*(oldsymbol{a}),$$

defined by

where I_N denotes the pseudo-spectral projection on the Fourier polynomials of degree N

 $\mathcal{N}^*(a) = \mathcal{Q} \circ I_{\mathcal{N}} \circ \mathcal{L}_{\mathcal{I}} \circ I_{\mathcal{N}} \circ \cdots \circ \mathcal{L}_1 \circ I_{\mathcal{N}} \circ \mathcal{R}(a),$

$$I_N: C(\mathbb{T}^d) \to L^2_N(\mathbb{T}^d), \quad u \mapsto I_N u.$$

So a $\psi ext{-FNO}$ can be identified with a finite-dimensional map

$$\widetilde{\mathcal{N}}^*: \mathbb{R}^{d_{oldsymbol{a}} imes \mathcal{I}_{oldsymbol{N}}}
ightarrow \mathbb{R}^{d_{oldsymbol{a}} imes \mathcal{I}_{oldsymbol{N}}}, \quad \widetilde{\mathcal{N}}^*(oldsymbol{a})_j = \mathcal{N}^*(oldsymbol{a})(x_j) \quad orall j \in \mathcal{I}_{oldsymbol{N}},$$

where the input $a=\{a_j\}_{j\in\mathcal{I}_N}$, $a_j=a(x_j)$ and $\mathcal{I}_N=\{1,\ldots,2N\}^d$.

Universal approximation for ψ -FNOs²

1 Fourier Neural Operator

Universal approximation for ψ -FNOs

Given s > d/2, s' > 0 and

$$\mathcal{G}: H^s(\mathbb{T}^d, \mathbb{R}^{d_a}) o H^{s'}(\mathbb{T}^d, \mathbb{R}^{d_u})$$

continuous operator. Given $K\subset H^s(\mathbb{T}^d,\mathbb{R}^{d_a})$ a compact set and $\sigma\in\mathbb{C}^\infty(\mathbb{R})$ a nonlinear and globally Lipschitz continuous function. Then, for any $\varepsilon>0$, exists an $N\in\mathbb{N}$ such that the ψ -FNO

$$\mathcal{N}^*: L^2_{\mathcal{N}}(\mathbb{T}^d, \mathbb{R}^{d_a}) \to L^2_{\mathcal{N}}(\mathbb{T}^d, \mathbb{R}^{d_u})$$

satisfy:

$$\sup_{a \in K} \|\mathcal{G}(a) - \mathcal{N}^*(a)\|_{H^{s'}} \leq \varepsilon.$$

Fourier continuation

2 Multi-patch domains

FNOs are limited to rectangular domains. To extend the operator to irregular domains, we can extend the domain to a larger rectangular domain and training the FNO to approximate the solution only on the original domain.

Periodic extension operator

Let $\Omega \subset \mathbb{R}^d$ be a bounded and Lipschitz domain. There exists a continuous. linear operator $\mathcal{E}: W^{m,p}(\Omega) \to W^{m,p}(B)$ for any $m \geq 0$ and $1 \leq p < \infty$, where B is an hyper-cube containing Ω , such that, for any $u \in W^{m,p}(\Omega)$:

- $\mathcal{E}(u)_{\mid_{\Omega}} = u$,
- $\mathcal{E}(u)$ is periodic on B, including its derivatives.

Fourier continuation

2 Multi-patch domains

FNOs are limited to rectangular domains. To extend the operator to irregular domains, we can extend the domain to a larger rectangular domain and training the FNO to approximate the solution only on the original domain.

Periodic extension operator

Let $\Omega \subset \mathbb{R}^d$ be a bounded and Lipschitz domain. There exists a continuous. linear operator $\mathcal{E}: W^{m,p}(\Omega) \to W^{m,p}(B)$ for any $m \geq 0$ and $1 \leq p < \infty$, where B is an hyper-cube containing Ω , such that, for any $u \in W^{m,p}(\Omega)$:

- $\mathcal{E}(u)_{\mid_{\Omega}} = u$,
- $\mathcal{E}(u)$ is periodic on B, including its derivatives.

But this can be computationally expensive.

Chebyshev Neural Operator

2 Multi-patch domains

Let $D \subset \mathbb{R}^d$ be a bounded domain. The Chebyshev Neural Operator (CNO) is a map

$$\mathcal{N}_{\theta}: \mathcal{A}(D, \mathbb{R}^{d_{\theta}}) \rightarrow \mathcal{U}(D, \mathbb{R}^{d_{u}}),$$

defined by

$$\mathcal{N}_{\theta}(\mathsf{a}) = \mathcal{Q} \circ \mathcal{L}_{\mathsf{L}} \circ \cdots \circ \mathcal{L}_{1} \circ \mathcal{P}(\mathsf{a}),$$

where is all defined as the FNO but in the integral operator we use the Chebyshev transform and anti-transform instead of the Fourier transform, i.e.

$$(\mathcal{K}_t(\theta_t)v)(x) = \mathcal{C}^{-1}(R_{\theta_t}(k)\cdot\mathcal{C}(v)(k))(x), \quad R_{\theta_t}(k) \in \mathbb{R}^{d_v \times d_v} \ \forall k \in \mathbb{N}^d.$$

Chebyshev Neural Operator

2 Multi-patch domains

Let $D \subset \mathbb{R}^d$ be a bounded domain. The Chebyshev Neural Operator (CNO) is a map

$$\mathcal{N}_{ heta}: \mathcal{A}(D, \mathbb{R}^{d_a})
ightarrow \mathcal{U}(D, \mathbb{R}^{d_u}),$$

defined by

$$\mathcal{N}_{\theta}(a) = \mathcal{Q} \circ \mathcal{L}_{I} \circ \cdots \circ \mathcal{L}_{1} \circ \mathcal{P}(a),$$

where is all defined as the FNO but in the integral operator we use the Chebyshev transform and anti-transform instead of the Fourier transform, i.e.

$$(\mathcal{K}_t(\theta_t)v)(x) = \mathcal{C}^{-1}(R_{\theta_t}(k) \cdot \mathcal{C}(v)(k))(x), \quad R_{\theta_t}(k) \in \mathbb{R}^{d_v \times d_v} \ \forall k \in \mathbb{N}^d.$$

At the discrete level, we can define the Pseudo Spectral Chebyshev Neural Operator $(\psi\text{-CNO})$ as before, with the difference that the grid \mathcal{I}_N is defined on a Chebyshev grid and not on an uniform one.

Boundary adapted Chebyshev basis

2 Multi-patch domains

The one dimensional Chebyshev polynomials are defined on the interval [-1,1], as $T_n(\cos(\theta)) = \cos(n\theta), n \in \mathbb{N}$ with the property that $T_n(1) = 1$ and $T_n(-1) = (-1)^n$. We define the boundary adapted Chebyshev basis as $B_0(x) = \frac{1}{2}(-x+1)$,

$$B_1(x) = \frac{1}{2}(x+1)$$
 and for $n \ge 2$

$$B_n(x) = \begin{cases} T_n(x) - T_0(x) & n \text{ is even,} \\ T_n(x) - T_1(x) & n \text{ is odd.} \end{cases}$$

Boundary adapted Chebyshev basis

2 Multi-patch domains

The one dimensional Chebyshev polynomials are defined on the interval [-1,1], as $T_n(\cos(\theta)) = \cos(n\theta)$, $n \in \mathbb{N}$ with the property that $T_n(1) = 1$ and $T_n(-1) = (-1)^n$. We define the boundary adapted Chebyshev basis as $B_0(x) = \frac{1}{2}(-x+1)$, $B_1(x) = \frac{1}{2}(x+1)$ and for $n \geq 2$

$$B_n(x) = \begin{cases} T_n(x) - T_0(x) & n \text{ is even,} \\ T_n(x) - T_1(x) & n \text{ is odd.} \end{cases}$$

For two dimensional Chebyshev polynomials we define $B_{n_1,n_2}(x,y) = B_{n_1}(x)B_{n_2}(y)$, $0 \le n_1, n_2 \le n$. Considering the square domain $D = [-1,1]^2$ we notice that there is only a function not equal to zero in each vertex of the square and there are only n functions that are not zero on each edge, $B_{i,j}(x,y)$ $2 \le i,j \le n$ are zero on the boundary.

Multi-patch domains

2 Multi-patch domains

If we have the domain D divided in N patches D_{ℓ} with $D = \bigcup_{\ell=1}^{N} D_{\ell}$ with $D_i \cap D_j = \emptyset$ or $D_i \cap D_i = \Gamma_{ii}$ for $i \neq j$.

We consider the L-domain

2 3

$$D = [-1, 1]^2 \setminus ([0, 1] \times [-1, 0])$$

divided in N=3 patches D_1,D_2,D_3 . We define the boundary adapted Chebyshev basis on each patch D_ℓ and denotes with $B_{i,j}^\ell$ with k=1,2,3 and $0\leq i,j\leq n$. To ensure the continuity on the interface $\Gamma_{1,2}$ and $\Gamma_{2,3}$ we have to impose that

$$b_{i,1}^0 = b_{i,0}^1, \quad b_{0,i}^2 = b_{1,i}^1, \quad \forall i = 1, \ldots, n.$$

Multi-patch Neural Operator

2 Multi-patch domains

The multi-patch neural operator is defined as the Chebyshev neural operator on each patch D_{ℓ} and the continuity on the interface is imposed using the boundary adapted Chebyshev basis in the following way:

- compute the Chebyshev discrete transform of the function v on each patch D_k , $(\mathcal{C}v^{\ell})(k)$ with $\ell=1,2,3$ and $0 \le i,j \le n$,
- multiply with the neural operator parameters $R_{\theta_*}(k) \cdot (\mathcal{C}v^{\ell})(k)$,
- compute the boundary adapted Chebyshev coefficients on each patch $b^{\ell}(k)$,
- impose the continuity on the interface $\Gamma_{1,2}$ and $\Gamma_{2,3}$,

update
$$b_{i,1}^0$$
, $b_{i,0}^1$ with $\frac{b_{i,1}^0+b_{i,0}^1}{2}$, update $b_{0,i}^2$, $b_{1,i}^1$ with $\frac{b_{0,i}^2+b_{1,i}^1}{2}$, $\forall i=1,\ldots,n$.

- go back to the Chebyshev coefficients on each patch,
- compute the Chebyshev inverse transform on each patch.

Problema di Darcy

3 Numerical experiments

For our numerical experiments we consider the Darcy problem:

$$\begin{cases} -\nabla(a\cdot\nabla u) = f, & \text{in } D\\ u = 0, & \text{on } \partial D \end{cases}$$

with the L-domain $D=[-1,1]^2\setminus ((0,1)\times (-1,0))$, diffusion coefficient $a\in \mathcal{A}=L^\infty(D,\mathbb{R}^+)$, and $f\equiv 1$. With this settings exists a unique solution $u\in H^1_0(D,\mathbb{R})$ and so we can define the solution operator

$$\mathcal{G}: L^{\infty}(D, \mathbb{R}^+) \to H^1_0(D, \mathbb{R}), \qquad \mathcal{G}: a \mapsto u.$$

Dataset generation

3 Numerical experiments

Massimiliano Ghiotto UNIVERSITÀ DI PAVIA

We have to generate the dataset $\left\{a^{(i)}, u^{(i)}\right\}_{i=1}^{N}$.

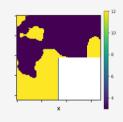

Dataset generation

3 Numerical experiments

We have to generate the dataset $\{a^{(i)}, u^{(i)}\}_{i=1}^{N}$.

For the input we use the push forward of a proper gaussian random fields $a^{(i)} \sim \mu = T_\# N(0,C)$ i.i.d. where $C = -(\Delta + 9I)^{-2}$ and $T: \mathbb{R} \to \mathbb{R}$ such that T gives 12 to the positive values and 3 to the negative ones.

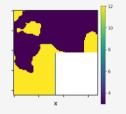

Dataset generation

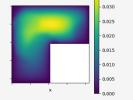

3 Numerical experiments

We have to generate the dataset $\{a^{(i)}, u^{(i)}\}_{i=1}^{N}$.

For the input we use the push forward of a proper gaussian random fields $a^{(i)} \sim \mu = T_\# N(0,C)$ i.i.d. where $C = -(\Delta + 9I)^{-2}$ and $T: \mathbb{R} \to \mathbb{R}$ such that T gives 12 to the positive values and 3 to the

negative ones.

For the output we approximate the solution of the Darcy problem solution $u^{(i)}=\mathcal{G}(a^{(i)})$ using the isogeometric geoPDEs library.

Relative L^2 error

3 Numerical experiments

We define the relative L^2 error as

$$\left\|\frac{\mathcal{G}-\mathcal{N}_{\theta}^*}{\mathcal{G}}\right\|_{L^2_{\mu}(L^{\infty},L^2)} = \mathbb{E}_{\boldsymbol{a}\sim \mu} \frac{\left\|\mathcal{G}(\boldsymbol{a})-\mathcal{N}_{\theta}^*(\boldsymbol{a})\right\|_{L^2(D)}^2}{\left\|\mathcal{G}(\boldsymbol{a})\right\|_{L^2(D)}^2}$$

that can be approximated by

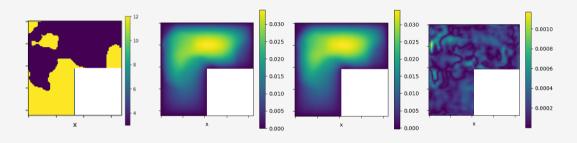

$$\left\|\frac{\mathcal{G}-\mathcal{N}_{\theta}^{*}}{\mathcal{G}}\right\|_{L_{u}^{2}(L^{\infty},L^{2})} \approx \frac{1}{N} \sum_{i=1}^{N} \left(\frac{\sum_{k=1}^{M} \left|u^{(i)}\left(x_{k}\right)-\mathcal{N}_{\theta}^{*}\left(a^{(i)}\right)\left(x_{k}\right)\right|^{2}}{\sum_{k=1}^{M} \left|u^{(i)}\left(x_{k}\right)\right|^{2}}\right).$$

Where $\{x_k\}_{k=1}^M \subset D$ is the set of the discretization points. That is a uniform (or Chebyshev) grid of 42 points per direction in every square patches.

Achievements:

- We have constructed a multi-patch neural operator for the Darcy problem on the L-domain.
- The neural operator is easily parallelizable between the patches.

Achievements:

- We have constructed a multi-patch neural operator for the Darcy problem on the L-domain.
- The neural operator is easily parallelizable between the patches.

Future works:

- Analyze if an universal approximation result can be obtained for the multi-patch neural operator.
- Use the multi-patch neural operator to approximate the solution of different PDEs.
- Extend the multi-patch neural operator to more complex geometries, with patches that are isomorphic to the square.

Universal approximation for ψ -FNOs

3 Numerical experiments

Teorema

Given s > d/2, $\lambda \in (0,1)$ and we consider the solution operator for the Darcy problem

$$\mathcal{G}: \mathcal{A}_{\lambda}^{s}(\mathbb{T}^{d}) \to H^{1}(\mathbb{T}^{d}).$$

Given $\sigma \in C^3(\mathbb{R})$ non-polynomial, for any $N \in \mathbb{N}$ exists C > 0 and a ψ -FNO

$$\mathcal{N}^*:\mathcal{A}^s_\lambda(\mathbb{T}^d) o H^1(\mathbb{T}^d)$$

such that

$$\sup_{\mathbf{a}\in\mathcal{A}_{s}^{s}}\|\mathcal{G}(\mathbf{a})-\mathcal{N}^{*}(\mathbf{a})\|_{H^{1}(\mathbb{T}^{d})}\leq CN^{-k}$$

 $\text{and } \operatorname{depth}(\mathcal{N}^*) \leq C \log(N), \ \operatorname{lift}(\mathcal{N}^*) \leq C, \ \operatorname{size}(\mathcal{N}^*) \lesssim N^d \log(N).$

Trasformata di Fourier

Massimiliano Ghiotto UNIVERSITÀ

DI PAVIA

3 Numerical experiments

• Given $v \in L^2(\mathbb{T}^d)$, the Fourier transform is defined as

$$\mathcal{F}: L^2(\mathbb{T}^d, \mathbb{C}^n) \to \ell^2(\mathbb{Z}^d, \mathbb{C}^n)$$

$$v \mapsto \mathcal{F}(v)$$

$$\mathcal{F}(v)(k) := \frac{1}{(2\pi)^d} \int_{\mathbb{T}^d} v(x) e^{-i\langle k, x \rangle} \ dx, \quad \forall k \in \mathbb{Z}^d.$$

• Given $\widehat{\mathbf{v}} = \{\widehat{\mathbf{v}}_k\}_{k \in \mathbb{Z}^d} \in \ell^2(\mathbb{Z}^d, \mathbb{C}^n)$, the anti-Fourier transform is defined as

$$\mathcal{F}^{-1}:\ell^2(\mathbb{Z}^d,\mathbb{C}^n) o L^2(D,\mathbb{C}^n) \ \widehat{v}\mapsto \mathcal{F}^{-1}(\widehat{v})$$

$$(\mathcal{F}^{-1}\widehat{v})(x) = \sum \widehat{v}_k e^{i\langle k, x \rangle} \qquad \forall x \in D.$$

Discrete Fourier transform and anti-transform

3 Numerical experiments

We choose $N \in \mathbb{N}$ and fix an uniform grid $\{x_j\}_{j \in \mathcal{I}_N}$ with $x_j = (2\pi j)/(2N+1) \in \mathbb{T}^d$, $j \in \mathcal{I}_N = \{0, \dots, 2N\}^d$, finally we define $\mathcal{K}_N := \{k \in \mathbb{Z}^d : |k|_\infty \leq N\}$. We define the discrete Fourier transform as

$$\mathcal{F}_{\mathsf{N}}:\mathbb{R}^{\mathcal{I}_{\mathsf{N}}}
ightarrow\mathbb{C}^{\mathcal{K}_{\mathsf{N}}}$$

$$\mathcal{F}_{N}(v)(k) := rac{1}{(2N+1)^{d}} \sum_{j \in \mathcal{I}_{N}} v(x_{j}) e^{-2\pi i \langle j,k \rangle/N}, \quad \forall k \in \mathcal{K}_{N},$$

and we define the discrete version of the anti-Fourier transform as

$${\mathcal F}_{\mathcal N}^{-1}: {\mathbb C}^{{\mathcal K}_{\mathcal N}} o {\mathbb R}^{{\mathcal I}_{\mathcal N}} \ {\mathcal F}_{\mathcal N}^{-1}(\widehat v)(j) := \sum_{k \in {\mathcal K}_{\mathcal N}} \widehat v_k e^{2\pi i \langle j,k
angle/{\mathcal N}}, \qquad orall j \in {\mathcal J}_{\mathcal N}.$$

Sketch of the proof of universal approximation theorem for FNOs

3 Numerical experiments

• The definition of the projection on the trigonometric polynomial is

$$P_N: L^2(\mathbb{T}^d) o L^2_N(\mathbb{T}^d), \ P_N\left(\sum_{k \in \mathbb{Z}^d} c_k e^{i\langle x,k \rangle}
ight) = \sum_{|k|_\infty \leq N} c_k e^{i\langle x,k \rangle}, \qquad orall (c_k)_{k \in \mathbb{Z}^d} \in \ell^2(\mathbb{Z}^d).$$

- If the universal approximation theorem holds for s' = 0 then it holds for any value of s' > 0.
- We fix s' = 0

$$\mathcal{G}_N:H^s(\mathbb{T}^d,\mathbb{R}^{d_a}) o L^2(\mathbb{T}^d,\mathbb{R}^{d_u}), \qquad \mathcal{G}_N(a):=P_N\mathcal{G}(P_Na),$$

holds that $\forall \varepsilon > 0$, $\exists N \in \mathbb{N}$ such that

$$\|\mathcal{G}(\mathsf{a}) - \mathcal{G}_{\mathsf{N}}(\mathsf{a})\|_{L^2} \leq \varepsilon, \qquad \forall \mathsf{a} \in \mathsf{K}.$$

Sketch of the proof of universal approximation theorem for FNOs

3 Numerical experiments

Define the operator

$$\widehat{\mathcal{G}}_N: \mathbb{C}^{\mathcal{K}_N} \to \mathbb{C}^{\mathcal{K}_N}, \qquad \widehat{\mathcal{G}}_N(\widehat{a}_k) := \mathcal{F}_N(\mathcal{G}_N(\text{Re}(\mathcal{F}_N^{-1}(\widehat{a}_k)))),$$

holds the following identity

$$G_N(a) = \mathcal{F}_N^{-1} \circ \widehat{G}_N \circ \mathcal{F}_N(P_N a),$$

for any function $a \in L^2(\mathbb{T}^d, \mathbb{R}^{d_a})$. So we reconduce to demonstrate that FNO can approximate

$$\mathcal{F}_N^{-1}, \ \widehat{\mathcal{G}}_N, \ \mathcal{F}_N(P_N a).$$

Definition MLP

3 Numerical experiments

Let $d \in \mathbb{N}$ and $L \in \mathbb{N}$ with $L \geq 2$ and $\sigma : \mathbb{R} \to \mathbb{R}$ a non-linear activation function. Let $A_\ell \in \mathbb{R}^{n_\ell \times n_{\ell-1}}$, $b_\ell \in \mathbb{R}^\ell$ with $n_\ell \in \mathbb{N}$ for $\ell = 1, \ldots, L$ and $n_0 = d$. We call multilayer perceptron (MLP) the function defined as

$$\begin{cases} x_{L} = A_{L}x_{L-1} + b_{L} \\ x_{\ell} = \sigma \left(A_{\ell}x_{\ell-1} + b_{\ell} \right) \end{cases},$$

where x_0 is the input and x_L is the output of the function.

Universal approximation theorem for operator

3 Numerical experiments

Suppose that $\sigma \in TW$, X is a Banach space, $K_1 \subset X$, $K_2 \subset \mathbb{R}^d$ are two compact sets in X and \mathbb{R}^d respectively, and V is a compact set in $C(K_1)$. Let G a nonlinear continuous operator which maps V into $C(K_2)$, then for any $\varepsilon > 0$, there are a positive integers n, p, m; real constants c_i^k , θ_i^k , ξ_{ij}^k , $\zeta^k \in \mathbb{R}$, points $w^k \in \mathbb{R}^d$ and $x_j \in K_1$, with $i = 1, \ldots, n$, $j = 1, \ldots, m$ and $k = 1, \ldots, p$, such that

$$\left| G(u)(y) - \sum_{k=1}^{p} \sum_{i=1}^{n} c_{i}^{k} \sigma \left(\sum_{j=1}^{m} \xi_{ij}^{k} u(x_{j}) + \theta_{i}^{k} \right) \sigma(w^{k} \cdot y + \zeta^{k}) \right| < \varepsilon$$

holds for all $u \in V$ and $y \in K_2$.
